

# Acceleration and Velocity as Arrows

acceleration tells us how much to change the velocity each second

therefore, the velocity will change by 2 m/s each second.

$-10 \text{ m/s} + 2 \text{ m/s} = -8 \text{ m/s}$

| Time | acceleration      | acceleration arrow | Velocity arrow | Velocity          |
|------|-------------------|--------------------|----------------|-------------------|
| 0    | $2 \text{ m/s/s}$ | $\rightarrow$      | $\leftarrow$   | $-10 \text{ m/s}$ |
| 1    | $2 \text{ m/s/s}$ | $\rightarrow$      | $\leftarrow$   | $-8 \text{ m/s}$  |
| 2    | $2 \text{ m/s/s}$ | $\rightarrow$      | $\leftarrow$   | $-6 \text{ m/s}$  |
| 3    | $2 \text{ m/s/s}$ | $\rightarrow$      | $\leftarrow$   | $-4 \text{ m/s}$  |
| 4    | $2 \text{ m/s/s}$ | $\rightarrow$      | $\leftarrow$   | $-2 \text{ m/s}$  |
| 5    | $2 \text{ m/s/s}$ | $\rightarrow$      | $\leftarrow$   | $0 \text{ m/s}$   |
| 6    | $2 \text{ m/s/s}$ | $\rightarrow$      | $\rightarrow$  | $2 \text{ m/s}$   |
| 7    | $2 \text{ m/s/s}$ | $\rightarrow$      | $\rightarrow$  | $4 \text{ m/s}$   |
| 8    | $2 \text{ m/s/s}$ | $\rightarrow$      | $\rightarrow$  | $6 \text{ m/s}$   |

The slope of a Velocity vs. Time graph is the Acceleration

The slope of a Distance vs. Time graph is the velocity.

A lacrosse player is sprinting at 6m/s. She scores a goal and then slows down to high five her team mates

1. What would her distance vs. time graph look like?

2. Draw a velocity time graph for this motion

10. Distance VS time: Slope = velocity

Velocity vs. time graph: slope= acceleration

11.

if there is a constant acceleration that means that the velocity has to be changing. Velocity is the slope of a distance time graph, so if the velocity is changing, the slope of a d vs t graph must also be changing.

12.

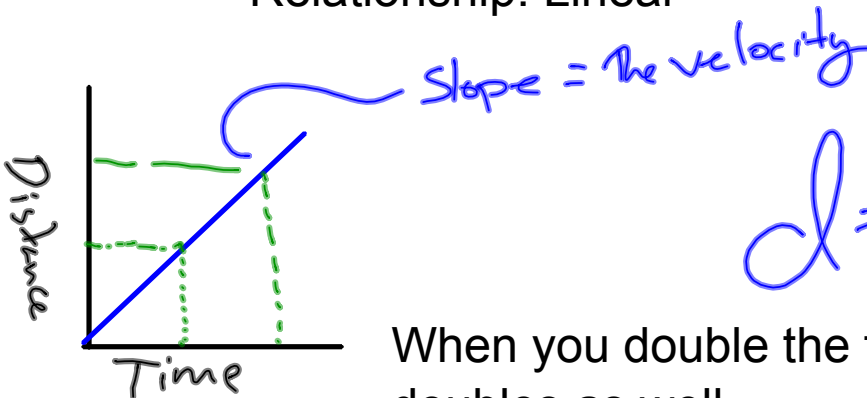

acceleration is the slope of a velocity time graph. we have a constant acceleration then there should be a constant slope to a V vs T graph.

## Motion Lab 1:

Distance vs. Time graphs with a constant velocity:

Relationship: Linear

$$d = v \cdot t$$

When you double the time, the distance doubles as well.

## Motion Lab 2:

Distance vs. Time graph with a Constant Acceleration

Relationship: Quadratic

$$d = \frac{1}{2} a t^2$$

*distance* *acceleration* *time*

When the time is doubled the distance is quadrupled.

Acceleration: A change in velocity over time.

$$a = \frac{V_f - V_i}{t}$$

$V_f$  ~ final velocity  
 $V_i$  ~ initial velocity  
 $t$  ~ time

$$a = \frac{\Delta v}{\Delta t}$$

$\Delta$  = delta = change in

Units:  $\frac{m/s}{s} = m/s/s = m/s^2$

$$\frac{\frac{m}{s}}{s} = \frac{m}{s} \cdot \frac{1}{s} = \frac{m}{s \cdot s} = \frac{m}{s^2}$$
